Computational Methods in Subsurface Flow

Peter S. Huyakorn

Computational Methods in Subsurface Flow Peter S. Huyakorn

Computational Methods in Subsurface Flow explores the application of all of the commonly encountered computational methods to subsurface problems. Among the problems considered in this book are groundwater flow and contaminant transport; moisture movement in variably saturated soils; land subsidence and similar flow and deformation processes in soil and rock mechanics; and oil and geothermal reservoir engineering.

This book is organized into 10 chapters and begins with an introduction to partial differential and various solution approaches used in subsurface flow. The discussion then shifts to the fundamental theory of the finite element method, with emphasis on the Galerkin finite element method and how it can be used to solve a wide range of subsurface problems. The subjects treated range from simple problems of saturated groundwater flow to more complex ones of moisture movement and multiphase flow in petroleum reservoirs. The chapters that follow focus on fluid flow and mechanical deformation of conventional and fractured porous media; point and subdomain collocation techniques and the boundary element technique; and the applications of finite difference techniques to single- and multiphase flow and solute transport. The final chapter is devoted to other alternative numerical methods that are based on combinations of the standard finite difference approach and classical mathematics.

This book is intended for senior undergraduate and graduate students in geoscience and engineering, as well as for professional groundwater hydrologists, engineers, and research scientists who want to solve or model subsurface problems using numerical techniques.

From reader reviews:

Scott Halpin:

The ability that you get from Computational Methods in Subsurface Flow could be the more deep you looking the information that hide into the words the more you get serious about reading it. It doesn't mean that this book is hard to recognise but Computational Methods in Subsurface Flow giving you enjoyment feeling of reading. The author conveys their point in a number of way that can be understood through anyone who read the idea because the author of this reserve is well-known enough. That book also makes your current vocabulary increase well. So it is easy to understand then can go with you, both in printed or e-book style are available. We propose you for having this particular Computational Methods in Subsurface Flow instantly.

Karen Lheureux:

Playing with family inside a park, coming to see the water world or hanging out with good friends is thing that usually you might have done when you have spare time, subsequently why you don't try thing that really opposite from that. One particular activity that make you not sense tired but still relaxing, trilling like on roller coaster you are ride on and with addition of knowledge. Even you love Computational Methods in Subsurface Flow, you could enjoy both. It is very good combination right, you still wish to miss it? What kind of hangout type is it? Oh occur its mind hangout fellas. What? Still don't buy it, oh come on its called reading friends.

Lauren Allison:

Do you have something that that suits you such as book? The book lovers usually prefer to opt for book like comic, short story and the biggest some may be novel. Now, why not hoping Computational Methods in Subsurface Flow that give your entertainment preference will be satisfied by simply reading this book. Reading practice all over the world can be said as the way for people to know world much better then how they react in the direction of the world. It can't be explained constantly that reading addiction only for the geeky particular person but for all of you who wants to end up being success person. So , for all of you who want to start examining as your good habit, you may pick Computational Methods in Subsurface Flow become your current starter.

Helen Price:

In this age globalization it is important to someone to obtain information. The information will make you to definitely understand the condition of the world. The health of the world makes the information much easier to share. You can find a lot of references to get information example: internet, paper, book, and soon. You will observe that now, a lot of publisher this print many kinds of book. The book that recommended to you personally is Computational Methods in Subsurface Flow this e-book consist a lot of the information in the condition of this world now. That book was represented how do the world has grown up. The language styles that writer use to explain it is easy to understand. The actual writer made some research when he makes this

book. This is why this book appropriate all of you.
