Magnetic Resonance Imaging of Carcinoma of the Urinary Bladder (Series in Radiology) Jelle O. Barentsz, Frans M. J. Debruyne, J.H.J. Ruijs

Carcinoma of the urinary bladder is a common (in the USA it is the fifth most common form of cancer in males and tenth most common form of cancer in females) malignant and one in which noninvasive staging by imaging plays such an important role. This book presents a complete approach to MR imaging of carcinoma of the urinary bladder from a detailed discussion of the value of MRI in the diagnosis of the urinary bladder to the history of the procedure. The technical discussion of the general principles of MRI including the optimal pulse sequences to be used and factors that influence the quality of images are included in this book. The safety factors are also presented along with contraindications. The application of a double surface coil with the field strength of 0.5T provides the fine quality of the illustrations. The atlas of comparative anatomy by MRI on normal volunteers and post-mortem specimens as well as MR images on patients with bladder tumors and post-surgery specimens is unique. The results of the clinical imaging studies in patients with carcinoma of the bladder, comparing the relative value of clinical staging, MR, CT and lymphography, are helpful in showing the advantages of MRI.
